

Grade 2 - Lesson 3

Create Slideshow from photos and/or drawings imported, with teacher assistance, that conveys an experience shared or a concept learned

Using whichever software application the school has available (KidPix™, PowerPoint™, Appleworks™, Preview(Apple), Google Docs™, etc...), the teacher will demonstrate, and then lead students through the procedure for inserting images into slide show.

1. Have students open folder in location (desktop, server, flash drive) where they had saved their drawings. Review with students how files are arranged in the folder, and what the names of the files are. *Notice, in the folder window shown, titles like “Cows”, “Landscape” are pretty helpful in knowing what a file contains, whereas “Picture 1” and “Picture 2” do little to help the student remember what the file contains. Students should always be specific when saving a file that will be used later.
2. Open Slideshow application. Show method for inserting student-made images. In PowerPoint, for example, the process is the following: once on the slide where the image is to be inserted, pull down **Insert** menu → **Picture** → **From File...** → navigate using the directory, to the folder where the images are stored.
3. Resize, adjust the position of image as necessary. Insert new slide; repeat process. As each image is successfully added, direct students to save their work.

When all of the images have been added, show students how they can use transitions to animate the change from one slide to another.

4. Text can also be added to each slide to serve as a caption for each image.
5. Have students present their slide shows to each other, and to parents at Open House, or some other event.
